1. Portfolio Executive Summary & Health Dashboard

The active portfolio consists of two specialized audio processing applications: **Music Separation iOS** (Source Separation / Stem Extraction) and **Vocal Cleaner** (Voice Restoration / Noise Reduction). Below is a side-by-side comparative health summary across key performance indicators (KPIs).

Side-by-Side Portfolio Overview

Metric	Music Separation iOS (`com.neuralsound.mss`)	Vocal Cleaner (`com.neuralSound.audiocleane`	Combined Portfolio Total
Health Score	**6.8 / 10**	**5.2 / 10**	**6.0 / 10**
Active Users (Yesterday)	36	1	37
Active Users (Past 30D)	2,229	31	2,260
Active Users (Lifetime)	6,478	47	6,525
Total Revenue (Past 30D)	$117.34	$182.82	$300.16
Total Revenue (Lifetime)	$217.73	$191.81	$409.54
ARPU (Past 30D)	$0.053	**$5.898**	$0.133
Primary Monetization Driver	Monthly Subscriptions ($44.15 / 30D)	300-Minute Consumable Packs ($128.78 / 30D)	Consumables & Subscriptions
Engagement Rate (7D)	76.1%	**92.5%**	77.3%
Crash-Free User Rate (Latest Build)	100.0% (v1.3.11)	100.0% (v1.0.04)	100.0%
Top Performing Market	Japan (30.5% AU)	Israel / Egypt (Whale Revenue)	Japan / Middle East

Portfolio Architectural Takeaways

1. **Volume vs. Value Divergence**:
2. **Music Separation iOS** acts as the primary **user acquisition driver** (2,229 Active Users in 30D), but suffers from low ARPU ($0.053) due to paywall drop-off and weak subscription conversion rates.
3. **Vocal Cleaner** operates as an **ultra-high ARPU engine** ($5.898 in 30D), driven almost exclusively by 300-minute consumable audio pack purchases ($128.78 share). However, user acquisition is near zero (1 AU yesterday, 31 in 30D).

4. **Monetization Mechanics**: Subscriptions perform well for recurring stem separation utility (Japan/Korea localized subs), while explicit high-volume consumable packs (300 minutes) unlock severe whale spending in utility audio workflows (Israel/Egypt power users buying multiple packs per session).

2. Dedicated Application Deep-Dives

APP 1: Music Separation iOS

Bundle ID: `com.neuralsound.mss` | **GA4 Property ID:** `533563138` | **Stream ID:** `14402502632`

App Header & Health Score

- **Health Score: 6.8 / 10**
- **Rationale:** Strong core feature retention and excellent 7-day engagement rates (76.1%). Crash stability is perfect (100.0% crash-free). However, user velocity shows a steep drop over the last 7 days (68 new users/day down to 6 new users/day), severe event flooding bug on slider controls (`player_tempo_changed` emitting 216.8 events/user), and low conversion from processing views to paid subscriber status.

Build Environment & Monetization Analysis

- **Build Distribution**: All listed purchase logs stem from valid production distributions (`1.3.10` and `1.3.11`). Internal sandbox testing (Bangladesh stream) was fully isolated. No sandbox retry loops or phantom transaction duplications were detected.
- **Subscription Strategy Performance**:
- **Monthly Subscriptions** account for **70.87%** ($44.15) of product revenue despite generating fewer total sales volume units (6 vs 8) than Weekly subs.
- **Geographic Monopolization**: Japan represents 56% of total transaction instances, followed by South Korea (21%). Standard Western tiers (US/EU) underperform due to lack of localized paywalls in non-Asian territories.

■ Multi-Horizon Growth & Historical Scale Comparison

Horizon	Active Users	New Users	Total Sessions	Engagement Rate	Total Revenue ($ USD)	ARPU ($ USD)
Yesterday	36	6	47	68.1%	$13.93	$0.387

■ Old vs. New User Cohort Deep-Dive

User Cohort	Active Users	Total Sessions	Avg Session Duration	Engagement Rate	Screen Page Views
Returning Users	28	35	409.4 sec (6m 49s)	74.3%	21
New Users	17	11	215.3 sec (3m 35s)	45.5%	13
Unattributed/System	0	3	9.1 sec	33.3%	1

- **Cohort Dynamic**: Returning users display almost **double the session length** (409s vs 215s) and **1.6x higher engagement** (74.3% vs 45.5%) compared to new users.
- **Onboarding Gap**: New user engagement drops off significantly (54.5% non-engaged rate), pointing to activation friction during initial audio file import and track separation setup.

■ 7-Day Velocity & Trajectory

Date	Active Users	New Users	Total Sessions	Engagement Rate	Velocity Vector
2026-10-11	149	62	186	80.1%	Baseline Peak
2026-10-12	183	68	233	78.5%	▲ High Growth Peak

2026-10-16	91	19	132	71.2%	▼ Low New User Baseline
2026-10-17	36	6	47	68.1%	▼ Trough (Yesterday)

Daily Trend Commentary

The application experienced an organic acquisition surge on Oct 11–12 peaking at 183 Active Users and 68 New Users. Beginning Oct 15, acquisition velocity decelerated rapidly, dropping 78% in daily new users (from 68 to 15, then down to 6 on Oct 17). This indicates either an expired App Store featuring banner, organic keyword ranking degradation, or reduced ad spend performance.

■■ Crash & Stability Health by App Version

App Version	Active Users	Total Sessions	Engagement Rate	Crash-Free Rate	Operational Status
1.3.11	36	47	68.1%	**100.0%**	Production Baseline (Current)
1.3.10	0 (Past: 1,800+)	0	0.0%	**100.0%**	Legacy Stable Rollout
1.3.07	0	0	0.0%	**100.0%**	Deprecated

- **Stability Assessment**: Version `1.3.11` is fully stable with zero crash events logged during the evaluation window.

■ Build & Staged Rollout Alert Section

- **Current Version Baseline**: `1.3.11` is deployed to 100% of production.
- **TestFlight / Sandbox Leakage**: **NONE**. The dataset confirms internal testers in Bangladesh are cleanly isolated from production GA4 properties.
- **Staged Rollout Alert**: Build `1.3.11` successfully replaced `1.3.10` with no regressions in overall crash-free rate. However, engagement dropped from 78.5% (v1.3.10 average) to 68.1% (v1.3.11 current baseline). Product team must verify if UI changes in 1.3.11 introduced onboarding friction.

Critical Telemetry Defect Analysis

- **Slider Debouncing Failure**: `player_tempo_changed` (867 events / 4 users = 216.8 events per user) and `player_pitch_changed` (714 events / 4 users = 178.5 events per user) reflect **severe telemetry spam**.
- **Root Cause**: Continuous UI pitch/tempo slider changes dispatch an analytics network payload on *every frame change pixel* instead of debouncing until user drag release (`touchUpOutside` / `touchUpInside`).
- **Impact**: Analytics event quota exhaustion, battery drain, network latency on active playback sessions, and skewing of event-per-session ratios.

APP 2: Vocal Cleaner

Bundle ID: `com.neuralSound.audiocleaner` | **GA4 Property ID:** `533563138` | **Stream ID:** `15407667671`

App Header & Health Score

- **Health Score: 5.2 / 10**
- **Rationale:** Exceptional revenue density per active user ($5.898 ARPU in 30D) driven by high-margin consumable packs (300 min). Engagement rate is extremely high (92.5%). However, top-of-funnel acquisition is critically starved (only 1 AU yesterday, 31 total active users in 30 days). App relies heavily on a small group of "whale" purchasers without a scalable top-of-funnel pipeline.

2026-09-20	1.0.01	`cleaner_weekly_sub`	Weekly	Egypt	1	$2.88

Build Environment & Monetization Analysis

- **Whale Purchase Behavior Identified**:
- On Sept 20, 2026, a single user session in Egypt generated **$94.96** across 7 consumable minute transactions (4x 300-min packs, 2x 60-min packs, 1x weekly sub).
- On Oct 11, 2026, a single user session in Israel generated **$39.10** across 3 transactions (2x 300-min packs, 1x 60-min pack).
- **Consumables vs Subscriptions**: Consumable Minute Packs drive **96.1% of revenue**. Subscriptions perform poorly ($6.12 total share) because utility studio professionals prefer high-capacity one-time minute top-ups (300 minutes) over automated weekly recurring commitments.

- **Historical 30D Cohort Profile**: Across the 30-day window, 31 total users generated 244 sessions. That equates to **7.87 sessions per user**, confirming that users who adopt Vocal Cleaner use it heavily for high-value voice cleaning tasks.

■ Build & Staged Rollout Alert Section

- **Current Distribution**: Version `1.0.04` is running in production with perfect crash-free metric (100.0%).
- **Build Progression Rate**: The application updated from `1.0.01` through `1.0.04` across 30 days.
- **Alert**: While code stability is high, user acquisition is near zero. The build progression has not fixed the core issue: a lack of organic top-of-funnel user growth.

Telemetry Observation

Telemetry for Vocal Cleaner is clean, with exact 1-to-1 event mappings per user. Unlike Music Separation iOS, there are no slider flooding issues. However, `vc_import_blocked_paywall` triggers immediately on attempt to import files without sufficient minutes, which can cause high drop-off for unpaid users who have not experienced product value yet.

```

1. **Fix Telemetry Defects Immediately (P0)**: Deploy hotfix build for `Music Separation iOS` to introduce a 500ms debounce handler on slider controls, eliminating the ~200 events/user telemetry spam.
2. **Capitalize on Vocal Cleaner's ARPU Engine (P0/P1)**: Vocal Cleaner generates **$5.898 ARPU** in 30D from high-value 300-minute pack purchases. Redirect marketing efforts and establish an App Store Search Ads campaign to scale user acquisition.
3. **Synergize Portfolio via Cross-Promotion (P2)**: Implement an in-app banner in Music Separation iOS after a user extracts a vocal stem: *"Clean background noise with Vocal Cleaner (3 Free Minutes Included)"*. This converts high-volume free users into high-ARPU studio buyers across the application ecosystem.
