Neural Sound iOS • Automated Daily Analytics Briefing • *2026-08-22*

Here is an executive-ready analytics briefing based on your daily iOS app performance report.

■ Executive Mobile Analytics Briefing

App Health Score: 8.2 / 10

- **Key Driver:** Exceptional top-of-funnel onboarding conversion (>95%) and deep session engagement (~10.4 mins/session).
- **Primary Risk:** Heavy reliance on new user acquisition (73.3% of DAU are new), high rate-prompt trigger frequency on Day 1, and analytics event spamming on slider interactions.

---

1. ■ Executive Summary

- **Strong Acquisition Day:** The app recorded **146 Active Users** across **186 Sessions**, driven primarily by **107 New Users** (73.3% of total DAU).
- **Exceptional Session Depth:** Average session duration reached **10 minutes 25 seconds** (625.4s) with an **84.9% Engagement Rate**, demonstrating strong utility once users enter the core experience.
- **Onboarding Friction is Minimal:** Over 95% of users who start onboarding complete both registration and their first app journey.
- **Power User Behavior:** Audio manipulation tools (Pitch and Tempo adjustment) show extreme engagement from a small niche cohort.

---

2. ■ User Activity & Engagement

Metric	Value	Specialist Commentary
Active Users (DAU)	**146**	Core daily cohort size.
New Users	**107** (73.3%)	Strong acquisition pull, but indicates low returning user baseline (39 returning users / 26.7%).
Sessions	**186**	~1.27 sessions per active user daily.
Engagement Rate	**84.9%**	Very high baseline for iOS utility/music tools (benchmark: ~60-70%).
Avg. Session Duration	**10m 25s**	High duration reflects active audio processing, playback, and stem editing.
Screen Views / Session	**~1.99**	Low screen navigation depth confirms users spend most of their time on a single interface (the Player/Stem screen).

---

3. ■ Feature & Event Performance

■ A. Onboarding & Registration Funnel (Extremely Healthy)

- **Start:** `onboarding_viewed` (111 users)
- **Completion:** `login_succeeded` (110 users) → **99.1% Conversion**

- **First Value Realized:** `first_journey_login_completed` (106 users) → **95.4% Overall Completion Rate**
- *Verdict:* The onboarding and login flow is seamless with almost zero drop-off.

■ B. Core Utility & Creation Funnel

1. **Initiation:** 105 users tapped `plus_button_tap`.
2. **Feature Choice:** 101 users chose `plus_separation_tapped`.
3. **Import Source:**
4. **Files App:** 78 users (`import_files_app_tap`)
5. **Photos Library:** 63 users (`import_photos_tap`)
6. **Player Conversion:**
7. 72 users opened the player (`separation_player_opened`).
8. **47 users actually hit play (`separation_play_started`).**
9. *Friction Warning:* **~34.7% drop-off** between opening the player and starting audio playback. This suggests potential processing delays, file load errors, or confusing UI controls.

■■ C. Power User Features & Analytics Noise

- **`player_pitch_changed`:** 5,706 events triggered by **only 10 users** (~570 events/user).
- **`player_tempo_changed`:** 2,046 events triggered by **only 9 users** (~227 events/user).
- **`player_stem_balance_changed`:** 132 events triggered by **1 single user**.
- *Insight:* Users tweaking sliders fire continuous analytics events on every step change. This inflates event volume and GA4 logging costs without providing additional behavioral value.

---

4. ■ App Version Adoption & Stability

```
App Version Distribution (Active Users) ■■■
```

1. **Optimize App Store Rating Prompt Timing (Critical):**
2. *Problem:* `rate_prompt_shown` was triggered for **122 users**, while total New Users were **107**. The prompt is likely being shown on Session 1 / Day 1 before value is established.

   Fix: Move the rating prompt trigger to a "Joy Moment"—e.g., after a user successfully completes their 3rd stem separation or spends >5 minutes in the player. Showing it immediately risks lower review scores.

   Focus on Day 1 -> Day 7 Retention:

5. *Problem:* 73.3% of DAU comes from new users, meaning retention of past cohorts is low.
6. *Fix:* Implement push notification re-engagement campaigns targeting users who imported audio but haven't returned in 48 hours (e.g., *"Your audio track is ready for key/pitch editing"*).
